DETAILED ACTION

Continued Examination Under 37 CFR 1.114

A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 11-1-02 has been entered.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

Claims 1-5, 7-18, and 21 are rejected under 35 U.S.C. 103(a) as being unpatentable over Izawa et al., JP 11-102894A in view of Wolf et al., "Silicon Processing for the VLSI Era Volume 1: Process Technology".

Izawa et al. shows the invention substantially as claimed including etching a wafer using ECR and controlling the generation ratio of F/CF₂ independently from the generation of ions, whereby the frequency is, for instance, 300 MHz (see page 2, paragraph 12), the pressure is 4Pa (see paragraph 13), and the distance between the wafer and the antenna is 100 mm (see paragraph 17).

Izawa et al. fails to expressly disclose introducing a gas selected from O₂, SF₆, CF₄, and SiF₄ into the etching treatment chamber in addition to Ar and a CF group gas. Wolf et al. discloses (see page 551, Figure 10) that the addition of O₂ to a fluorocarbon based etchant will reduce the amount of polymerization during etching and increase the etch rate (see also, first full paragraph on page 549). In view of this disclosure, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the process of Izawa et al., JP 11-102894A so as to add a diatomic oxygen gas to the etchant compositions because this will increase the etch rate and reduce the amount of etchant by-products deposited on the workpiece.
